----	----------------------------

## 1.0 Background and Purpose

The objective of the United States Clean Water Act (USCWA) is to "*restore and maintain* the chemical, physical, and biological integrity of the Nation's Waters" (USCWA, 1988). In order to meet this objective, and exert its sovereign authority to protect its water resources, the Navajo Nation codified the Navajo Nation Clean Water Act (NNCWA 1999) in July 1999. The importance of water to the Navajo Nation is clearly demonstrated by the adoption of the NNCWA, with the Navajo Nation being only one of a few tribes or states to adopt a formal clean water act. The NNCWA provides the legislative authority to allow the Navajo Nation to fulfill the USCWA requirements.

In order to *restore and maintain* the chemical, physical, and biological integrity of the Nation's Water, states and federally recognized tribes adopt water quality standards which protect the uses of the Nation's water bodies. Water quality standards are narrative and numeric criteria used as benchmarks to determine if a designated use for a water body is being attained. NNCWA Section 103(a)(2)(A) provides for "the establishment of water quality standards to protect fish and wildlife and the domestic, cultural, agricultural and recreational uses of the waters of the Navajo Nation." This is consistent with the "fishable and swimmable goal" set forth in USCWA Sections 101(a)(2) and 303(c)(2). NNCWA Sections 201(b) and (c) requires that designated uses be established for public water supplies, the protection and propagation of fish and wildlife, recreational purposes, agricultural (including livestock watering), industrial, cultural, and other uses, and to establish criteria to protect the designated uses.

The Navajo Nation first codified the 1999 Navajo Nation Water Quality Standards (1999 NNWQS) in July 1999 (NNEPA 1999). On January 20, 2006 the US Environmental Protection Agency (USEPA) approved the Navajo Nation's application to administer the Water Quality Standards and Certification Programs under the federal Clean Water Act's Sections 303 and 401. On March 26, 2009, the USEPA approved the 2007 Navajo Nation Surface Water Quality Standards (NNSWQS) (NNEPA 2008). A draft of the 2010 NNSWQS (NNEPA 2010) is currently awaiting public review.

The Navajo Nation Environmental Protection Agencies (NNEPA) Water Quality / National Pollutant Discharge Elimination System Program (WQ/NPDES Program) is responsible for implementing the requirements of the USCWA and the NNCWA within the Navajo Nation.

This report fulfills the USCWA Section 305(b) reporting requirements, USCWA 303(d) listing requirements, USEPA's USCWA § 106 Tribal Guidance, Chapter 8 and Appendix A, assessment reporting requirements, and Fiscal Year 2013 National Water Program Guidance Measures WQ-06a and WQ-06b. It also fulfills assessment reporting requirements in the "Navajo Nation Environmental Protection Agency Water Quality/National Pollutant Discharge Elimination System Program, Federal Clean Water Act Performance Partnership Grant" Work Plan.

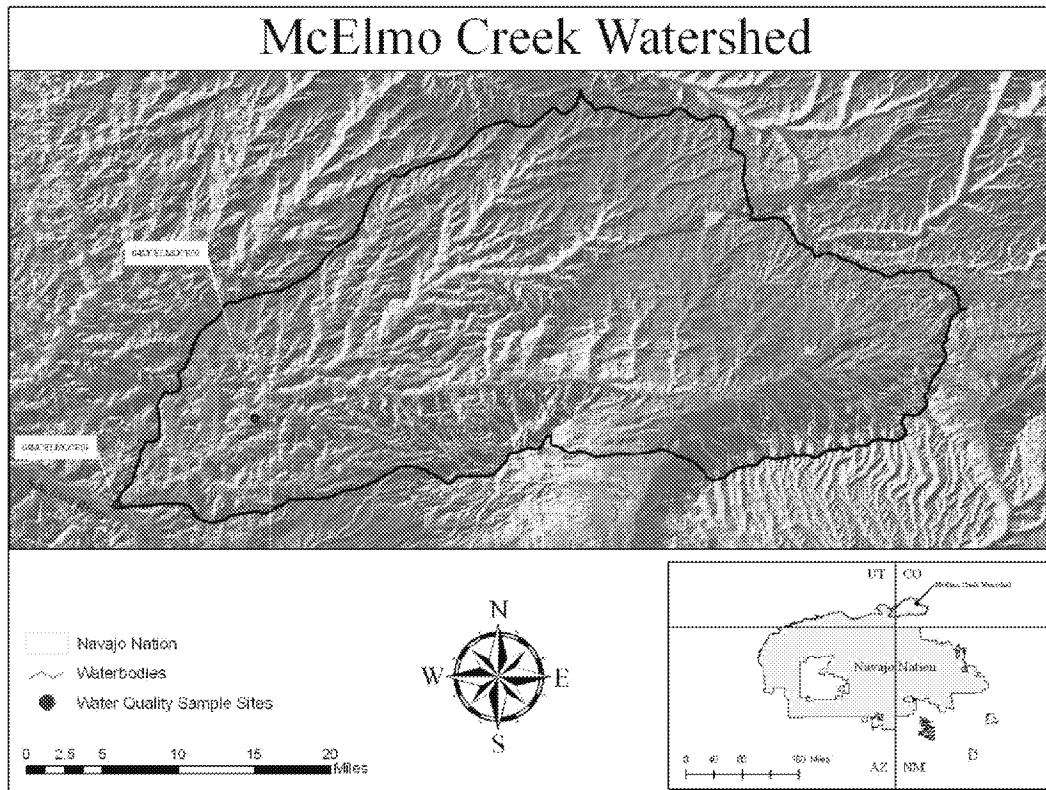

The purpose of this report is to assess McElmo Creek surface water quality data obtained by the Navajo Nation Environmental Protection Agency Water Quality/NPDES Program (NNEPA WQP) by:

1. Presenting the surface water quality data;
2. Comparing the surface water quality data to the latest version of the Navajo Nation Surface Water Quality Standards to see if standards are being attained;
3. Determine if uses designated for McElmo Creek surface waters are being supported and determine if McElmo Creek is impaired using the methods described in the February 20, 2008 NNEPA document entitled: "Guidance for Assessing the Quality of Navajo Nation Surface Waters to Determine Impairment" (Integrated 305(b) Reporting and 303(d) Listing); and
4. Make recommendations for further surface water quality data gathering.

The Navajo Nation McElmo Creek Surface Water Quality Assessment is intended to be a living document, which can be updated to include the latest surface water quality data. The WQ/NPDES Program welcomes all comments that will assist in revising this report in the future.

## 2.0      McElmo Creek Watershed (HUC 14080202)

The McElmo Creek Watershed (Figure 2.0) is located on 702 square miles within the San Juan River Basin. 17.76 stream miles are located within the Navajo Nation. The United States Geological Survey's 8-digit Hydrologic Unit Code for the McElmo Creek Watershed is 14080202 (USGS 1987). Water bodies located in the Navajo Nation within this watershed are listed in Table 2.0. The uses that are designated for these water bodies are listed in Table 2.1.

**Figure 2.0 – McElmo Creek Watershed**

**Table 2.0 - McElmo Creek Watershed Atlas of Surface Water Bodies**  
(from Navajo Nation Department of Water Resources - March 31, 2009)

Surface Water Body Name	Length (miles) or Area (acres)
McElmo Creek	17.76

**Table 2.1 – McElmo Creek Watershed Surface Waters with Designated Uses**

(from 2007 Navajo Nation Surface Water Quality Standards, Table 205.1)

Surface Water Body Name	Designated Uses*
McElmo Creek	PrHC, ScHC, AgWS FC, A&WHbt, and LW

Footnotes: \* = Designated Uses are: Dom = Domestic Water Supply, PrHC = Primary Human Contact, ScHC = Secondary Human Contact, AgWS = Agricultural Water Supply, FC = Fish Consumption, A&WHbt = Aquatic and Wildlife Habitat, and LW = Livestock Watering.

### 3.0      McElmo Creek Surface Water Quality Data Collection Activities

McElmo Creek is the only surface water body from which water quality data was obtained within the McElmo Creek Watershed. Monitoring and water quality sampling of McElmo Creek was conducted at the sites listed in Table 3.0. These activities were undertaken using professional experience and in accordance with the WQ/NPDES Program's June 1, 2012 "Quality Assurance Plan for Surface Water Data Collection" or previous quality assurance plans.

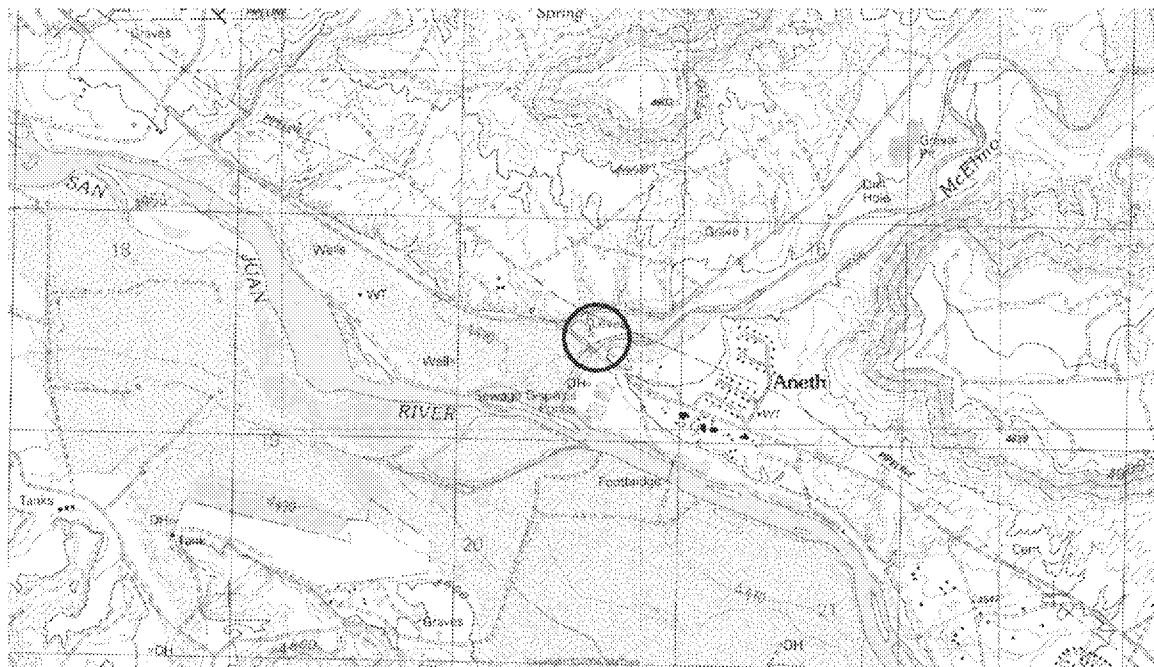

**Table 3.0 – McElmo Creek Sampling Locations and Dates.**

Surface Water Body Name	Site Name	Years Sampled
McElmo Creek	04MCELMOCR01	1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2008, 2009, 2010, 2011
McElmo Creek	04MCELMOCR02	2002

Water quality sampling was conducted in the years listed in Table 3.0. Measurements of physical/ chemical characteristics and stream discharge were made. Samples were obtained and submitted to an analytical laboratory for analyses. Quality Assurance and Quality Control samples were also obtained.

### 3.1 McElmo Creek Site 04MCELMOCR01

Sample site 04MCELMOCR01 is located near Aneth, Utah up gradient of the San Juan River confluence. McElmo Creek crosses Highway 262 and is predominately perennial at this location (Map 3.1). Photographs of surface flow conditions at site 04MCELMOCR01 are provided below.

Map 3.1 Location of Site 04MCELMOCR01.

### 3.1.2 Non-Attainment of 2010 NNSWQS for Site 04MCELMOCR01

A list of parameters which did not attain the corresponding 2010 NNSWQS numeric standard for McElmo Creek designated uses is provided in Table 3.1.2. Table 3.1.2 provides the parameter name, the analytical result, and the numeric Surface Water Quality Standard (SWQS) for the corresponding designated use. Trivalent chromium (0.24 milligrams per liter) did not attain the chronic numeric standard of 0.23 milligrams per liter for the aquatic and wildlife designated use. Cyanide (0.0061 milligrams per liter) did not attain the chronic numeric standard of 0.0052 milligrams per liter for the aquatic and wildlife designated use. Mercury (1.3 to 9.8 nanograms per liter) did not attain the chronic numeric standard of 1.0 nanograms per liter for the aquatic and wildlife designated use. Selenium (0.002 to 0.0052 milligrams per liter) did not attain the chronic numeric standard of 0.002 milligrams per liter for the aquatic and wildlife designated use. (It should be noted that insufficient sampling was conducted to determine a true “chronic” value since samples were not obtained during four consecutive days). Escherichia coli (900 Most Probable Number per 100 milliliters (MPN/100 ml) did not attain the numeric standards for the primary and secondary human contact designated uses of 235 and 575 MPN/100 ml respectively . Total nitrate and nitrate nitrogen (0.57 and 0.82 milligrams per liter) did not attain the numeric standard of 0.132 milligrams per liter for the livestock watering designated use.

Table 3.1.2 - Non-Attainment of 2010 NNSWQS for Site 04MCELMOCR01

Sample Date	Parameter	Fraction	Result	Units	Designated Use	SWQS

06/13/2011	Selenium	T	0.0025	mg/L	A&WHbt Chronic	0.002 T

KEY: mg/L = milligrams per Liter, ng/L = nanograms per Liter, ug/L = micrograms per Liter, pCi = picoCuries per Liter. MPN = Most Probable Number, T = Total (not filtered), D = Dissolved (filtered with 0.45 um filter), CFU = Coliform Forming Units

### 3.1.3 Parameters of Interest at Site 04MCELMOCR01

In addition to the parameters not attaining the numeric standards, there are other parameters which are of interest in assessing McElmo Creek surface water quality at this site. These parameters are listed in Table 3.1.3.

The WQ/NPDES Program has begun analyzing sampled surface waters for pharmaceutical and personal care products. While there are currently no 2010 NNSWQS numeric standards for these compounds, their presence indicates the extent to which these compounds are present in aquatic environments. Pharmaceutical and personal care product compounds present at this site include: Acetaminophen (analgesic), caffeine (stimulant), carbamazepine (anticonvulsant), hydrocodone (narcotic), methadone (narcotic), N,N-Diethyl-meta-toluamide (DEET – insect repellant), sulfamethoxazole (antibiotic), and trimethoprim (antibiotic). Sources of these compounds are usually attributable to waste water discharges. These discharges may occur from point sources such as municipal waste water treatment systems and/or from septic system leach fields.

Additional parameters of interest are total dissolved solids, total suspended solids, and uranium. Total dissolved solids ranged from 892 to 2000 milligrams per liter indicating fairly saline waters. This may be attributable to agricultural return flows in the watershed concentrating salts in those waters. Total suspended solids ranged from 26 to 3200 milligrams per liter. Higher surface water flows present during precipitation events increase suspended solid concentrations. Uranium was present at concentrations ranging from 0.00346 to 0.0109 milligrams per liter. There is no uranium numeric standard for the McElmo Creek designated uses. The NNSWQS does, however have a uranium numeric standard of 0.03 milligrams per liter for the Domestic Water Supply designated use and a numeric standard of 2.8 milligrams per liter for the Secondary Human Contact designated use. Uranium concentrations at McElmo Creek attained these standards.

### 3.1.4 Designated Use Support Determination at Site 04MCELMOCR01

For those parameters not attaining the numeric standards (see Table 3.1.2) a determination if the designated use for that standard is supported is made using the “Summary of Data Required to Determine Designated Use Support” found in Table 1 of the NNEPA Integrated 305(b) Reporting and 303(d) Listing guidance. Table 1 provides the minimum number of values and the number or percent non-attainment of the water quality standard required to determine designated use support for each parameter. The minimum number of values required to determine support of the designated uses for those parameters and designated uses in Table 3.1.3 is five values in three years. If the water quality standard is not attained one or less times the designated use is supported. If the water quality standard is not attained two or more times the designated use is not supported for that parameter.

From Table 3.1.1 the trivalent chromium result in 1999 was the only one of the five results from the three years (1999 to 2002) which did not attain the chronic numeric standard. ***Since this is one or less non attainment of the five values obtained, the Aquatic and Wildlife designated use for the chronic trivalent chromium standard is supported.***

From Table 3.1.1 the Escherichia coli results in 2000 were the only two consecutive times these values were obtained. Since a minimum of ten values were not obtained in ten years a determination of designated use support cannot be made.

From Table 3.1.1 the cyanide result in 2005 was the only one of the three results from the three years (2005 to 2008) which did not attain the aquatic and wildlife habitat chronic numeric standard. However a minimum of five samples was not obtained during this time-frame so a determination of designated use support cannot be made.

Mercury did not attain the aquatic and wildlife habitat chronic numeric standard five times in three years from 2008 to 2011. ***Since this is two or more non attainments of the five values obtained, the Aquatic and Wildlife designated use for the chronic mercury standard is not supported.***

From Table 3.1.1 the total nitrogen nitrate and nitrite results in 2004 and 2005 were the only two consecutive years when these values were obtained. Since a minimum of five samples were not obtained in three years a determination of designated use support cannot be made.

From Table 3.1.1 selenium did not attain the aquatic and wildlife habitat chronic numeric standard five times in three years from 2000 to 2003. *Since this is two or more non attainments of the six values obtained, the Aquatic and Wildlife designated use for the chronic selenium standard is not supported.*

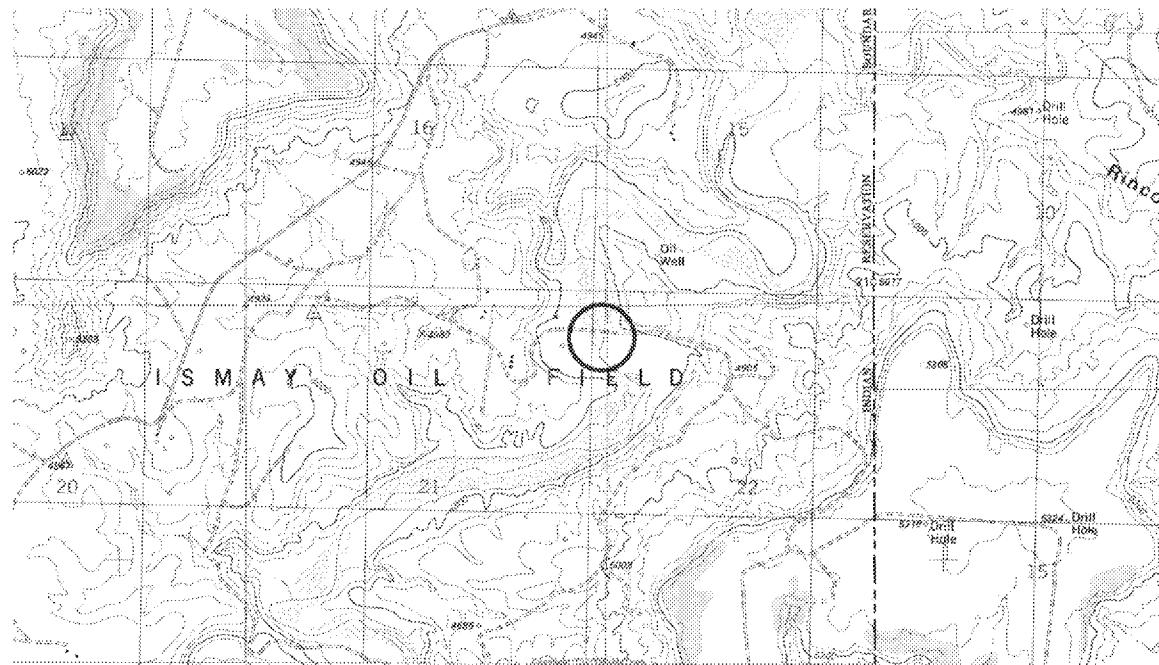

### 3.1.5 Categories of Designated Use Support and Impairment Determination

Once a determination of designated use support is made for a given water surface body using Table 1 of the NNEPA Integrated 305(b) Reporting and 303(d) Listing guidance, surface water body segments are assigned one of five-categories based on their designated use support status to determine if the surface water should be listed as *impaired*. These five categories may be found in Section 3.2 of NNEPA Integrated 305(b) Reporting and 303(d) Listing guidance. Only surface water reaches falling into Category 5 will be considered *impaired* and listed on the federal Clean Water Act Section 303(d) list.

For the aquatic and wildlife habitat chronic numeric standards for mercury and selenium the most appropriate category at this point is Category 4c. Category 4c states that the “designated use is not supported because the water body is impaired, but the impairment may not be caused by a pollutant. (Pollutant is defined in NNSWQS Section 104). This can include flow alterations and/or naturally occurring elements.” This provides the opportunity to determine if the presence of mercury and selenium in McElmo Creek is from natural and/or anthropogenic sources. While the aquatic and wildlife designated use is not supported for the chronic mercury and selenium standards, McElmo Creek will not be listed under USCWQA Section 303(d) as impaired.

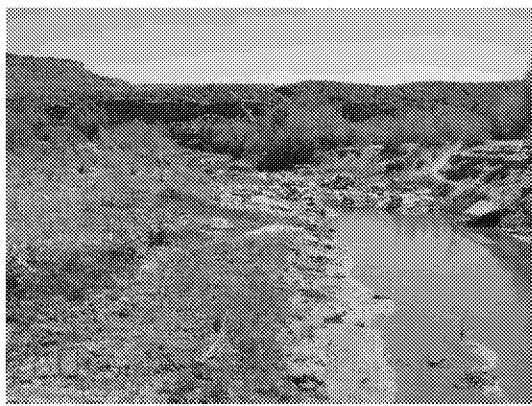

### 3.2 McElmo Creek Site 04MCELMOCR02

Sample site 04MCELMOCR02 is located up gradient of Site 04MCELMOCR01. McElmo Creek crosses County Road 407 and is predominately perennial at this location (Map 3.2). Photographs of surface flow conditions at site 04MCELMOCR02 are provided below.

Map 3.2 – Location of Site 04MCELMOCR02.

#### Photographs of Sampling Site 04MCELMOCR02:

August 26, 2002.

August 26, 2002.

### 3.2.1 McElmo Creek Site 04MCELMOCR02 Water Quality Data

A summary of all analytical and field data obtained at this site is provided in Table 3.2.1.

### 3.2.2 Non-Attainment of NNSWQS for Site 04MCELMOCR01

All NNSWQS numeric criteria were attained for those parameters with numeric criteria listed in Table 3.2.1. Therefore a determination of designated use support and water body impairment will not be made.

### 3.2.3 Parameters of Interest at Site 04MCELMOCR02

Parameters which are of interest in assessing McElmo Creek surface water quality at this site are listed in Table 3.2.3.

Total dissolved solids values of 1881 and 2300 milligrams per Liter indicate fairly saline waters. This may be attributable to agricultural return flows in the watershed concentrating salts in those waters. The total suspended solids value of 23 milligrams per liter indicates base flow conditions. Uranium was present at concentrations ranging from 0.0093 milligrams per liter. As previously stated there is no uranium numeric standard for the McElmo Creek designated uses. The NNSWQS does, however have a uranium numeric standard of 0.03 milligrams per liter for the Domestic Water Supply designated use and a numeric standard of 2.8 milligrams per liter for the Secondary Human Contact designated use. The uranium concentration at this site was below these values and therefore attained these standards.
